

# The package **piton**<sup>\*</sup>

F. Pantigny  
fpantigny@wanadoo.fr

May 23, 2024

## Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

## 1 Presentation

The package **piton** uses the Lua library LPEG<sup>1</sup> for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with **lualatex** only (and won't work with the other engines: **latex**, **pdflatex** and **xelatex**). It does not use external program and the compilation does not require **--shell-escape**. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment **{Piton}**.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages **listings** and **minted**.

The name of this extension (**piton**) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

---

<sup>\*</sup>This document corresponds to the version 3.0b of **piton**, at the date of 2024/05/23.

<sup>1</sup>LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

<sup>2</sup>This LaTeX escape has been done by beginning the comment by **#>**.

## 2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

## 3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

### 3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

### 3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`<sup>3</sup>;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the native languages supported by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

### 3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.

---

<sup>3</sup>That language `minimal` may be used to format pseudo-codes: cf. p. 29

- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 6.2, p. 12.

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

### 3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),  
but the command `\_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,  
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested  
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands<sup>4</sup> are fully expanded and not executed,  
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#"      # an affectation }
\piton{c="#" \ \ \ # an affectation }
\piton{MyDict = {'a': 3, 'b': 4 }}
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.<sup>5</sup>

- **Syntax `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#"      # an affectation +
\piton?MyDict = {'a': 3, 'b': 4}?
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4}
```

---

<sup>4</sup>That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

<sup>5</sup>For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

## 4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt{}`.

### 4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.<sup>6</sup>

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). Five values are allowed : Python, OCaml, C, SQL and minimal. The initial value is Python.
- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer  $n$ : the first  $n$  characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value  $n$  of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of  $n$ .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number  $n$  of spaces on that line and applies `gobble` with that value of  $n$ . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content<sup>7</sup> of the current environment in that file. At the first use of a file by `piton`, it is erased.
- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).<sup>8</sup>
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.<sup>9</sup>
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.2, p. 12). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.

<sup>6</sup>We remind that a LaTeX environment is, in particular, a TeX group.

<sup>7</sup>In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 20).

<sup>8</sup>For the language Python, the empty lines in the docstrings are taken into account (by design).

<sup>9</sup>When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.1 on page 21.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

*Example :* `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 6.1.2, p. 11).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX<sup>10</sup>.

For an example of use of `width=min`, see the section 8.2, p. 21.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters<sup>11</sup> are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.<sup>12</sup>

*Example :* `my_string = 'Very□good□answer'`

---

<sup>10</sup>The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latextmk` (used by Overleaf) do automatically a sufficient number of compilations.

<sup>11</sup>With the language Python that feature applies only to the short strings (delimited by ' or "). In OCaml, that feature does not apply to the *quoted strings*.

<sup>12</sup>The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`<sup>13</sup> is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by piton. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C,line-numbers,auto-gobble,background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 10).

## 4.2 The styles

### 4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.<sup>14</sup>

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

---

<sup>13</sup>cf. 6.1.2 p. 11

<sup>14</sup>We remind that a LaTeX environment is, in particular, a TeX group.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `lua-ul` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 9, starting at the page 25.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word **function** formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style *style*.

#### 4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.<sup>15</sup>

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).<sup>16</sup>

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

---

<sup>15</sup>We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

<sup>16</sup>As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

#### 4.2.3 The style UserFunction

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.<sup>17</sup>

### 4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.<sup>18</sup>

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{\begin{tcolorbox}}{\end{tcolorbox}}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
  {\begin{tcolorbox}}
  {\end{tcolorbox}}
```

<sup>17</sup>We remind that, in `piton`, the name of the informatic languages are case-insensitive.

<sup>18</sup>However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

## 5 Definition of new languages with the syntax of listings

### New 3.0

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C++, SQL and `minimal`), which allows more powerful parsers.

For example, in the file `lstlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
} [keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
}
```

It's possible to use the language Java like any other language defined by piton.  
Here is an example of code formatted in an environment {Piton} with the key `language=Java`.<sup>19</sup>

```
public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}
```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `*` and `**`), `moredirective`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `\` and `_` are considered as letters because, in many informatic languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

## 6 Advanced features

### 6.1 Page breaks and line breaks

#### 6.1.1 Page breaks

By default, the listings produced by the environment {Piton} and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the keys `split-on-empty-lines` and `splittable` to allow such breaks.

---

<sup>19</sup>We recall that, for piton, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

- The key `split-on-empty-lines` allows breaks on the empty lines<sup>20</sup> in the listing. In the informatic listings, the empty lines usually separate the definitions of the informatic functions and it's pertinent to allow breaks between these functions.

In fact, when the key `split-on-empty-lines` is in force, the work goes a little further than merely allowing page breaks: several successive empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`. The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break).

- Of course, the key `split-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value  $n$  (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the  $n$  first lines of the listing or within the  $n$  last lines. For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.<sup>21</sup>

### 6.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+\\;` (the command `\\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\\hookrightarrow\\;$`.

The following code has been composed with the following tuning:

---

<sup>20</sup>The “empty lines” are the lines which contains only spaces.

<sup>21</sup>With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}

def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+       ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
        our_dict[name] = [treat_Postscript_line(k) for k in \
+           ↪ list_letter[1:-1]]
    return dict
```

## 6.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

### 6.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

### 6.2.2 With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}

def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

### 6.3 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.<sup>22</sup>
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 6).

*Caution:* Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```
\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
```

By using the command `\SetPitonIdentifier`, it’s possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}>

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}
```

---

<sup>22</sup>We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

```
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

## 6.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `\{Piton\}` many commands and environments of Beamer: cf. 6.5 p. 18.

### 6.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the `piton` style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.2 p. 21

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.<sup>23</sup>

---

<sup>23</sup>That feature is implemented by using a redefinition of the standard command `\label` in the environments `\{Piton\}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

#### 6.4.2 The key “math-comments”

It's possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is an example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

#### 6.4.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informative listing).

We assume that the preamble of the LaTeX document contains the following line.

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

#### 6.4.4 The mechanism “escape”

It's also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, available only in the preamble of the document.

We consider once again the previous example of a recursive programming of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `luatex`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square

brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!, end-escape=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

*Caution :* The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with #>; such comments are merely called “LaTeX comments” in this document).

#### 6.4.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character \$ does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character \$:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character \$ must *not* be protected by a backslash.

However, it's probably more prudent to use \(` et \)`.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \( -\arctan(-x) \)
    elif \(x > 1\) :
        return \( (\pi/2 - \arctan(1/x)) \)
    else:
        s = \(0\)
        for \(k\) in range(\(n\)): s += \( \smash{\frac{(-1)^k}{2k+1}} x^{2k+1} \)
        return s
\end{Piton}
```

```

1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return π/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)k x2k+1 / (2k+1)
9         return s

```

## 6.5 Behaviour in the class Beamer

*First remark*

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.<sup>24</sup>

When the package `piton` is used within the class `beamer`<sup>25</sup>, the behaviour of `piton` is slightly modified, as described now.

### 6.5.1 {Piton} et \PitonInputFile are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

### 6.5.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause`<sup>26</sup> ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings<sup>27</sup> of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

---

<sup>24</sup>Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

<sup>25</sup>The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

<sup>26</sup>One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

<sup>27</sup>The short strings of Python are the strings delimited by characters ' or the characters " and not ''' nor """. In Python, the short strings can't extend on several lines.

```

\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}

```

In the previous example, the braces in the Python strings "{" and "}" are correctly interpreted (without any escape character).

### 6.5.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When piton is used in the class beamer, the following environments of Beamer are directly detected in the environments {Piton} (and in the listings processed by \PitonInputFile): {actionenv}, {alertenv}, {invisibleenv}, {onlyenv}, {uncoverenv} and {visibleenv}. However, there is a restriction: these environments must contain only *whole lines of Python code* in their body.

Here is an example:

```

\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
        return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

### Remark concerning the command \alert and the environment {alertenv} of Beamer

Beamer provides an easy way to change the color used by the environment {alertenv} (and by the command \alert which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment {Piton}, such tuning will probably not be the best choice because piton will, by design, change (most of the time) the color the different elements of text. One may prefer an environment {alertenv} that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command \highLight of luatex (that extension requires also the package luacolor).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment{\alertenv}{\only#1{\highLight{alerted text.bg}}}{}}
\makeatother

```

That code redefines locally the environment `{alertyenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertyenv}`).

## 6.6 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferentially. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

In this document, the package `piton` has been loaded with the option `footnotehyper`. For examples of notes, cf. 8.3, p. 22.

## 6.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by  $n$  spaces. The initial value of  $n$  is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value  $n$  of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of  $n$  (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces).

# 7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

### New 2.6

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.4.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.4.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.5, p. 24.

## 8 Examples

### 8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers`.

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

### 8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)   another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```
\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

### 8.3 Notes in the listings

In order to be able to extract the notes (which are typeset with the command `\footnote`), the extension piton must be loaded with the key `footnote` or the key `footnotehyper` as explained in the section 6.6 p. 20. In this document, the extension piton has been loaded with the key `footnotehyper`. Of course, in an environment `{Piton}`, a command `\footnote` may appear only within a LaTeX comment (which begins with `#>`). It's possible to have comments which contain only that command `\footnote`. That's the case in the following example.

```
\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)28
    elif x > 1:
        return pi/2 - arctan(1/x)29
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

---

<sup>28</sup>First recursive call.

<sup>29</sup>Second recursive call.

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emphase\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}

adef arctan(x,n=10):
a    if x < 0:
a        return -arctan(-x)a
b    elif x > 1:
b        return pi/2 - arctan(1/x)b
c    else:
c        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

---

<sup>a</sup>First recursive call.

<sup>b</sup>Second recursive call.

## 8.4 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. We use the font *DejaVu Sans Mono*<sup>30</sup> specified by the command `\setmonofont` of `fontspec`.

That tuning uses the command `\highLight` of `luatex` (that package requires itself the package `luacolor`).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually

---

<sup>30</sup>See: <https://dejavu-fonts.github.io>

in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in `piton` is *not* empty.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) =  $\pi/2$  for  $x > 0$ )
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

## 8.5 Use with pyluatex

The package `pylumatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```
\NewPitonEnvironment{PitonExecute}{!0{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pylumatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}
\ignorespacesafterend}
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 20.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

## 9 The styles for the different computer languages

### 9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.<sup>31</sup>

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code> )
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & .   @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code> )
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code> )
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code> )
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

<sup>31</sup>See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color #F0F3F3. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

## 9.2 The language OCaml

It's possible to switch to the language OCaml with \PitonOptions{language = OCaml}.

It's also possible to set the language OCaml for an individual environment {Piton}.

```
\begin{Piton}[language=OCaml]
...
\end{Piton}
```

The option exists also for \PitonInputFile : \PitonInputFile[language=OCaml]{...}

Style	Use
Number	the numbers
String.Short	the characters (between ' )
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : and, asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, begin, class, constraint, done, downto, do, else, end, exception, external, for, function, functor, fun , if include, inherit, initializer, in , lazy, let, match, method, module, mutable, new, object, of, open, private, raise, rec, sig, struct, then, to, try, type, value, val, virtual, when, while and with

### 9.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & .   @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

## 9.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code> )
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

## 9.5 The language “minimal”

It's possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It's also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=minimal]{...}`

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.3, p. 14) in order to create, for example, a language for pseudo-code.

## 9.6 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)

## 10 Implementation

The development of the extension `piton` is done on the following GitHub depot:  
<https://github.com/fpantigny/piton>

### 10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.<sup>32</sup>

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{}}"b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Name.Function}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Keyword}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}" }
{ "{\PitonStyle{Number}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}" }
{ "\\\_piton_end_line:" }
```

---

<sup>a</sup>Each line of the Python listings will be encapsulated in a pair: `\_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `\_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

<sup>b</sup>The lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

<sup>c</sup>`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

---

<sup>32</sup>Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton\_newline:
```

## 10.2 The L3 part of the implementation

### 10.2.1 Declaration of the package

```
1  {*STY}
2  \NeedsTeXFormat{LaTeX2e}
3  \RequirePackage{l3keys2e}
4  \ProvidesExplPackage
5    {piton}
6  {\PitonFileVersion}
7  {\PitonFileDate}
8  {Highlight informatic listings with LPEG on LuaLaTeX}

9  \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
10 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
11 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }

14 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { piton } }
15 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { piton } }
16 \cs_new_protected:Npn \@@_gredirect_none:n #1
17  {
18    \group_begin:
19    \globaldefs = 1
20    \msg_redirect_name:nnn { piton } { #1 } { none }
21    \group_end:
22 }
```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
23 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
24  {
25    \bool_if:NTF \g_@@_messages_for_Overleaf_bool
26      { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
27      { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
28 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```
29 \cs_new_protected:Npn \@@_error_or_warning:n
30  { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```
31 \bool_new:N \g_@@_messages_for_Overleaf_bool
32 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
33  {
34    \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs
35    || \str_if_eq_p:on \c_sys_jobname_str { output } % for Overleaf
36  }
```

138      \bool_gset_true:N \g_@@_footnote_bool
139    }
140  }

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

```

141 \lua_now:n
142 {
143   piton.ListCommands = lpeg.P ( false )
144   piton.last_code = ''
145   piton.last_language = ''
146 }

```

### 10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

147 \str_new:N \l_piton_language_str
148 \str_set:Nn \l_piton_language_str { python }

```

Each time the command `\PitonInputFile` of `piton` is used, the code of that environment will be stored in the following global string.

```
149 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
150 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
151 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

152 \bool_new:N \l_@@_in_PitonOptions_bool
153 \bool_new:N \l_@@_in_PitonInputFile_bool

```

We will compute (with Lua) the numbers of lines of the Python code and store it in the following counter.

```
154 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the Python codes.

```
155 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will count all the lines, empty or not empty. It won't be used to print the numbers of the lines.

```
156 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) information to write on the `aux` (to be used in the next compilation).

```
157 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to `n`, then no line break can occur within the first `n` lines or the last `n` lines of the listings.

```
158 \int_new:N \l_@@_splittable_int
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
159 \tl_new:N \l_@@_split_separation_tl
160 \tl_set:Nn \l_@@_split_separation_tl { \vspace{\baselineskip} \vspace{-1.25pt} }
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
161 \int_set:Nn \l_@@_splittable_int { 100 }
```

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
162 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
163 \tl_new:N \l_@@_prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
164 \str_new:N \l_@@_begin_range_str
165 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
166 \str_new:N \l_@@_file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
167 \int_new:N \g_@@_env_int
```

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

```
168 \str_new:N \l_@@_write_str
169 \seq_new:N \g_@@_write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
170 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
171 \bool_new:N \l_@@_break_lines_in_Piton_bool
172 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
173 \tl_new:N \l_@@_continuation_symbol_tl
174 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
175 \tl_new:N \l_@@_csoi_tl
176 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
177 \tl_new:N \l_@@_end_of_broken_line_tl
178 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
179 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

180 `\dim_new:N \l_@@_width_dim`

We will also use another dimension called `\l_@@_line_width_dim`. That will be the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

181 `\dim_new:N \l_@@_line_width_dim`

The following flag will be raised with the key `width` is used with the special value `min`.

182 `\bool_new:N \l_@@_width_min_bool`

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line will be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

183 `\dim_new:N \g_@@_tmp_width_dim`

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

184 `\dim_new:N \l_@@_left_margin_dim`

The following boolean will be set when the key `left-margin=auto` is used.

185 `\bool_new:N \l_@@_left_margin_auto_bool`

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

186 `\dim_new:N \l_@@_numbers_sep_dim`

187 `\dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }`

The tabulators will be replaced by the content of the following token list.

188 `\tl_new:N \l_@@_tab_tl`

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

189 `\seq_new:N \g_@@_languages_seq`

```

190 \cs_new_protected:Npn \@@_set_tab_tl:n #1
191 {
192     \tl_clear:N \l_@@_tab_tl
193     \prg_replicate:nn { #1 }
194         { \tl_put_right:Nn \l_@@_tab_tl { ~ } }
195 }
196 \@@_set_tab_tl:n { 4 }
```

When the key `show-spaces` is in force, `\l_@@_tab_t1` will be replaced by an arrow by using the following command.

```

197 \cs_new_protected:Npn \@@_convert_tab_t1:
198 {
199   \hbox_set:Nn \l_tmpa_box { \l_@@_tab_t1 }
200   \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
201   \tl_set:Nn \l_@@_tab_t1
202   {
203     \c{\mathcolor{gray}}
204     { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } \c{} }
205   }
206 }
```

The following integer corresponds to the key `gobble`.

```
207 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```

208 \tl_new:N \l_@@_space_t1
209 \tl_set_eq:NN \l_@@_space_t1 \nobreakspace
```

At each line, the following counter will count the spaces at the beginning.

```
210 \int_new:N \g_@@_indentation_int
```

```

211 \cs_new_protected:Npn \@@_an_indentation_space:
212   { \int_gincr:N \g_@@_indentation_int }
```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```

213 \cs_new_protected:Npn \@@_beamer_command:n #
214 {
215   \str_set:Nn \l_@@_beamer_command_str { #1 }
216   \use:c { #1 }
217 }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```

218 \cs_new_protected:Npn \@@_label:n #
219 {
220   \bool_if:NTF \l_@@_line_numbers_bool
221   {
222     \@bsphack
223     \protected@write \auxout { }
224     {
225       \string \newlabel { #1 }
226     }
227   }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```

228   { \int_eval:n { \g_@@_visual_line_int + 1 } }
229   { \thepage }
230 }
231 \@esphack
232 }
233 { \@@_error:n { label-with-lines-numbers } }
234 }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by piton the part which must be included (and formatted).

```
235 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
236 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
237 \cs_new_protected:Npn \@@_open_brace: { \lua_now:n { piton.open_brace() } }
238 \cs_new_protected:Npn \@@_close_brace: { \lua_now:n { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
239 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
240 \cs_new_protected:Npn \@@_prompt:
241 {
242     \tl_gset:Nn \g_@@_begin_line_hook_tl
243     {
244         \tl_if_empty:NF \l_@@_prompt_bg_color_tl
245             { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
246     }
247 }
```

### 10.2.3 Treatment of a line of code

The following command is only used once.

```
248 \cs_new_protected:Npn \@@_replace_spaces:n #1
249 {
250     \tl_set:Nn \l_tmpa_tl { #1 }
251     \bool_if:NTF \l_@@_show_spaces_bool
252     {
253         \tl_set:Nn \l_@@_space_tl { \_ }
254         \regex_replace_all:nnN { \x20 } { \_ } \l_tmpa_tl % U+2423
255     }
256 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
257     \bool_if:NT \l_@@_break_lines_in_Piton_bool
258     {
259         \regex_replace_all:nnN
260             { \x20 }
261             { \c { @@_breakable_space: } }
262         \l_tmpa_tl
263     }
264     \l_tmpa_tl
265 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```

267 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
268 {
269   \group_begin:
270   \g_@@_begin_line_hook_tl
271   \int_gzero:N \g_@@_indentation_int

```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```

272 \bool_if:NTF \l_@@_width_min_bool
273   \@@_put_in_coffin_i:n
274   \@@_put_in_coffin_i:n
275 {
276   \language = -1
277   \raggedright
278   \strut
279   \@@_replace_spaces:n { #1 }
280   \strut \hfil
281 }

```

Now, we add the potential number of line, the potential left margin and the potential background.

```

282 \hbox_set:Nn \l_tmpa_box
283 {
284   \skip_horizontal:N \l_@@_left_margin_dim
285   \bool_if:NT \l_@@_line_numbers_bool
286   {
287     \bool_if:nF
288     {
289       \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{}{} }
290       &&
291       \l_@@_skip_empty_lines_bool
292     }
293     { \int_gincr:N \g_@@_visual_line_int }
294   \bool_if:nT
295   {
296     ! \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{}{} }
297     ||
298     ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
299   }
300   \@@_print_number:
301 }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

302 \clist_if_empty:NF \l_@@_bg_color_clist
303 {
... but if only if the key left-margin is not used !
304   \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
305   { \skip_horizontal:n { 0.5 em } }
306 }
307 \coffin_typeset:Nnnnn \l_tmpa_coffin T 1 \c_zero_dim \c_zero_dim
308 }
309 \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
310 \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
311 \clist_if_empty:NTF \l_@@_bg_color_clist
312 { \box_use_drop:N \l_tmpa_box }
313 {
314   \vtop
315   {
316     \hbox:n
317     {
318       \color:N \l_@@_bg_color_clist
319       \vrule height \box_ht:N \l_tmpa_box
320         depth \box_dp:N \l_tmpa_box

```

```

321           width \l_@@_width_dim
322       }
323   \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
324   \box_use_drop:N \l_tmpa_box
325 }
326 }
327 \vspace { - 2.5 pt }
328 \group_end:
329 \tl_gclear:N \g_@@_begin_line_hook_tl
330 }
```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```

331 \cs_set_protected:Npn \@@_put_in_coffin_i:n
332   { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }
```

The second case is the case when the key `width` is used with the special value `min`.

```

333 \cs_set_protected:Npn \@@_put_in_coffin_i:n #1
334 {
```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```
335   \hbox_set:Nn \l_tmpa_box { #1 }
```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```

336 \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
337   { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
338 \hcoffin_set:Nn \l_tmpa_coffin
339   {
340     \hbox_to_wd:nn \l_@@_line_width_dim
```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 21).

```

341   { \hbox_unpack:N \l_tmpa_box \hfil }
342 }
343 }
```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

344 \cs_set_protected:Npn \@@_color:N #1
345 {
346   \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
347   \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
348   \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
349   \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

350   { \dim_zero:N \l_@@_width_dim }
351   { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
352 }
```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

353 \cs_set_protected:Npn \@@_color_i:n #1

659 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

660 \NewDocumentCommand \@@_fake_PitonOptions { }
661 { \keys_set:nn { PitonOptions } }

```

### 10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`).

```

662 \int_new:N \g_@@_visual_line_int
663 \cs_new_protected:Npn \@@_incr_visual_line:
664 {
665   \bool_if:NF \l_@@_skip_empty_lines_bool
666   { \int_gincr:N \g_@@_visual_line_int }
667 }

668 \cs_new_protected:Npn \@@_print_number:
669 {
670   \hbox_overlap_left:n
671   {
672     {
673       \color { gray }
674       \footnotesize
675       \int_to_arabic:n \g_@@_visual_line_int
676     }
677     \skip_horizontal:N \l_@@_numbers_sep_dim
678   }
679 }

```

### 10.2.6 The command to write on the aux file

```

680 \cs_new_protected:Npn \@@_write_aux:
681 {
682   \tl_if_empty:NF \g_@@_aux_tl
683   {
684     \iow_now:Nn \mainaux { \ExplSyntaxOn }
685     \iow_now:Nx \mainaux
686     {

```

```

687          \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
688          { \exp_not:o \g_@@_aux_tl }
689      }
690      \iow_now:Nn \mainaux { \ExplSyntaxOff }
691  }
692  \tl_gclear:N \g_@@_aux_tl
693 }

```

The following macro will be used only when the key `width` is used with the special value `min`.

```

694 \cs_new_protected:Npn \@@_width_to_aux:
695 {
696     \tl_gput_right:Nx \g_@@_aux_tl
697     {
698         \dim_set:Nn \l_@@_line_width_dim
699         { \dim_eval:n { \g_@@_tmp_width_dim } }
700     }
701 }

```

### 10.2.7 The main commands and environments for the final user

```

702 \NewDocumentCommand { \NewPitonLanguage } { O { } m ! o }
703 {
704     \tl_if_no_value:nTF { #3 }

```

The last argument is provided by curryfication.

```

705     { \@@_NewPitonLanguage:nnn { #1 } { #2 } }

```

The two last arguments are provided by curryfication.

```

706     { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
707 }

```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```

708 \prop_new:N \g_@@_languages_prop

709 \keys_define:nn { NewPitonLanguage }
710 {
711     morekeywords .code:n = ,
712     otherkeywords .code:n = ,
713     sensitive .code:n = ,
714     keywordsprefix .code:n = ,
715     moretexcs .code:n = ,
716     morestring .code:n = ,
717     morecomment .code:n = ,
718     moredelim .code:n = ,
719     moredirectives .code:n = ,
720     tag .code:n = ,
721     alsodigit .code:n = ,
722     alsoletter .code:n = ,
723     alsoother .code:n = ,
724     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
725 }

```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```

726 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
727 {

```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : [AspectJ]{Java}. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[ ]{Java}{...}`.

```

728 \tl_set:Nx \l_tmpa_tl
729 {
730     \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
731     \str_lowercase:n { #2 }
732 }

```

The following set of keys is only used to raise an error when a key is unknown!

```

733 \keys_set:nn { NewPitonLanguage } { #3 }

```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```

734 \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }

```

The Lua part of the package piton will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```

735 \exp_args:NV \@@_NewPitonLanguage:nn \l_tmpa_tl { #3 }
736 }
737 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
738 {
739     \hook_gput_code:nnn { begindocument } { . }
740     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
741 }

```

Now the case when the language is defined upon a base language.

```

742 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
743 {

```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{}{...}`

```

744 \tl_set:Nx \l_tmpa_tl
745 {
746     \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
747     \str_lowercase:n { #4 }
748 }

```

We retrieve in `\l_tmpb_tl` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by piton but only those defined by using `\NewPitonLanguage`.

```

749 \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl

```

We can now define the new language by using the previous function.

```

750 { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
751 { \@@_error:n { Language-not-defined } }
752 }

```

```

753 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4

```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```

754 { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }

```

If the final user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`. The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

883 \cs_new_protected:Npn \@@_compute_left_margin:nn #1 #2
884 {
885     \bool_lazy_and:nnT \l_@@_left_margin_auto_bool \l_@@_line_numbers_bool
886     {
887         \hbox_set:Nn \l_tmpa_box
888         {
889             \footnotesize
890             \bool_if:NTF \l_@@_skip_empty_lines_bool
891             {
892                 \lua_now:n
893                 { \piton.#1(token.scan_argument()) }
894                 { #2 }
895                 \int_to_arabic:n
896                 { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
897             }
898             {
899                 \int_to_arabic:n
900                 { \g_@@_visual_line_int + \l_@@_nb_lines_int }
901             }
902         }
903         \dim_set:Nn \l_@@_left_margin_dim
904         { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
905     }
906 }
907 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }
```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```

908 \cs_new_protected:Npn \@@_compute_width:
909 {
910     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
911     {
912         \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
913         \clist_if_empty:NTF \l_@@_bg_color_clist
```

If there is no background, we only subtract the left margin.

```
914     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```
915     {
916         \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }
```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical

value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value<sup>33</sup> and we use that value. Elsewhere, we use a value of 0.5 em.

```

917     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
918         { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
919         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
920     }
921 }
```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the aux file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

922 {
923     \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
924     \clist_if_empty:NTF \l_@@_bg_color_clist
925         { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
926         {
927             \dim_add:Nn \l_@@_width_dim { 0.5 em }
928             \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
929                 { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
930                 { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
931         }
932     }
933 }
```

  

```

934 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
935 {
```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

936 \use:x
937 {
938     \cs_set_protected:Npn
939         \use:c { _@@_collect_ #1 :w }
940         ####1
941         \c_backslash_str end \c_left_brace_str #1 \c_right_brace_str
942     }
943     {
944         \group_end:
945         \mode_if_vertical:TF \mode_leave_vertical: \newline
946 }
```

We count with Lua the number of lines of the argument. The result will be stored by Lua in `\l_@@_nb_lines_int`. That information will be used to allow or disallow page breaks. The use of `token.scan_argument` avoids problems with the delimiters of the Lua string.

```
946     \lua_now:n { piton.CountLines(token.scan_argument()) } { ##1 }
```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

947     \@@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
948     \@@_compute_width:
949     \ttfamily
950     \dim_zero:N \parskip
```

Now, the key `write`.

```

951     \str_if_empty:NTF \l_@@_path_write_str
952         { \lua_now:e { piton.write = "\l_@@_write_str" } }
953         {
954             \lua_now:e
955                 { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
956         }
957     \str_if_empty:NTF \l_@@_write_str
958         { \lua_now:n { piton.write = '' } }
```

---

<sup>33</sup>If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

```

959         {
960             \seq_if_in:NNTF \g_@@_write_seq \l_@@_write_str
961                 { \lua_now:n { piton.write_mode = "a" } }
962                 {
963                     \lua_now:n { piton.write_mode = "w" }
964                     \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
965                 }
966             }

```

Now, the main job.

```

967         \bool_if:NTF \l_@@_split_on_empty_lines_bool
968             \@@_gobble_split_parse:n
969             \@@_gobble_parse:n
970             { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```
971             \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```

972         \end { #1 }
973         \@@_write_aux:
974     }

```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment`...

```

975     \NewDocumentEnvironment { #1 } { #2 }
976     {
977         \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
978         #3
979         \@@_pre_env:
980         \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
981             { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
982         \group_begin:
983         \tl_map_function:nN
984             { \ \ \ \{ \} \$ \& \# \^ \_ \% \~ \^\I }
985             \char_set_catcode_other:N
986             \use:c { _@@_collect_ #1 :w }
987         }
988     { #4 }

```

The following code is for technical reasons. We want to change the catcode of `\^\M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `\^\M` is converted to space).

```

989     \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^\M }
990 }

```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryification.

```

991 \cs_new_protected:Npn \@@_gobble_parse:n
992 {
993     \lua_now:e
994     {
995         piton.GobbleParse
996         (
997             '\l_piton_language_str' ,
998             \int_use:N \l_@@_gobble_int ,
999             token.scan_argument ( )
1000         )

```

```

1001     }
1002 }
```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```

1003 \cs_new_protected:Npn \@@_gobble_split_parse:n
1004 {
1005     \lua_now:e
1006     {
1007         piton.GobbleSplitParse
1008         (
1009             '\l_piton_language_str' ,
1010             \int_use:N \l_@@_gobble_int ,
1011             token.scan_argument ( )
1012         )
1013     }
1014 }
```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```

1015 \bool_if:NTF \g_@@_beamer_bool
1016 {
1017     \NewPitonEnvironment { Piton } { d < > 0 { } }
1018     {
1019         \keys_set:nn { PitonOptions } { #2 }
1020         \tl_if_novalue:nTF { #1 }
1021             { \begin { uncoverenv } }
1022             { \begin { uncoverenv } < #1 > }
1023     }
1024     { \end { uncoverenv } }
1025 }
1026 {
1027     \NewPitonEnvironment { Piton } { 0 { } }
1028     { \keys_set:nn { PitonOptions } { #1 } }
1029     { }
1030 }
```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

1031 \NewDocumentCommand { \PitonInputFileTF } { d < > 0 { } m m m }
1032 {
1033     \group_begin:

```

We add the word `String` to the list of the styles because we will use that list in the error message for an unknown key in `\SetPitonStyle`.

```
1230 \clist_gput_left:Nn \g_@@_styles_clist { String }
```

Of course, we sort that clist.

```

1231 \clist_gsort:Nn \g_@@_styles_clist
1232 {
1233     \str_compare:nNnTF { #1 } < { #2 }
1234     \sort_return_same:
1235     \sort_return_swapped:
1236 }
```

### 10.2.9 The initial styles

The initial styles are inspired by the style “manni” of Pygments.

```

1237 \SetPitonStyle
1238 {
1239     Comment          = \color[HTML]{0099FF} \itshape ,
1240     Exception        = \color[HTML]{CC0000} ,
1241     Keyword          = \color[HTML]{006699} \bfseries ,
1242     Keyword.Constant = \color[HTML]{006699} \bfseries ,
1243     Name.Builtin     = \color[HTML]{336666} ,
1244     Name.Decorator   = \color[HTML]{9999FF},
1245     Name.Class       = \color[HTML]{00AA88} \bfseries ,
1246     Name.Function    = \color[HTML]{CC00FF} ,
1247     Name.Namespace   = \color[HTML]{00CCFF} ,
1248     Name.Constructor = \color[HTML]{006000} \bfseries ,
1249     Name.Field       = \color[HTML]{AA6600} ,
1250     Name.Module      = \color[HTML]{0060A0} \bfseries ,
1251     Name.Table       = \color[HTML]{309030} ,
1252     Number           = \color[HTML]{FF6600} ,
1253     Operator          = \color[HTML]{555555} ,
1254     Operator.Word    = \bfseries ,
1255     String            = \color[HTML]{CC3300} ,
```

```

1256 String.Doc      = \color[HTML]{CC3300} \itshape ,
1257 String.Interpol = \color[HTML]{AA0000} ,
1258 Comment.LaTeX   = \normalfont \color[rgb]{.468,.532,.6} ,
1259 Name.Type       = \color[HTML]{336666} ,
1260 InitialValues  = \texttt{@@_piton:n} ,
1261 Interpol.Inside = \color{black}\texttt{@@_piton:n} ,
1262 TypeParameter   = \color[HTML]{336666} \itshape ,
1263 Preproc          = \color[HTML]{AA6600} \slshape ,
1264 Identifier       = \texttt{@@_identifier:n} ,
1265 Directive        = \color[HTML]{AA6600} ,
1266 Tag              = \colorbox{gray!10}{},
1267 UserFunction     = ,
1268 Prompt            = ,
1269 ParseAgain.noCR  = \texttt{@@_piton_no_cr:n} ,
1270 ParseAgain        = \texttt{@@_piton:n} ,
1271 Discard           = \texttt{use_none:n}
1272 }

```

The last styles `ParseAgain.noCR` and `ParseAgain` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document these styles for the final user (why not?).

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```

1273 \AtBeginDocument
1274 {
1275   \bool_if:NT \g_@@_math_comments_bool
1276     { \SetPitonStyle { Comment.Math = \texttt{@@_math_scantokens:n} } }
1277 }

```

### 10.2.10 Highlighting some identifiers

```

1278 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1279 {
1280   \clist_set:Nn \l_tmpa_clist { #2 }
1281   \tl_if_no_value:nTF { #1 }
1282   {
1283     \clist_map_inline:Nn \l_tmpa_clist
1284       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1285   }
1286   {
1287     \str_set:Nx \l_tmpa_str { \str_lowercase:n { #1 } }
1288     \str_if_eq:ont \l_tmpa_str { current-language }
1289     { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1290     \clist_map_inline:Nn \l_tmpa_clist
1291       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1292   }
1293 }
1294 \cs_new_protected:Npn \texttt{@@_identifier:n} #1
1295 {
1296   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1297   { \cs_if_exist_use:c { PitonIdentifier _ #1 } }
1298   { #1 }
1299 }

```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```

1300 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1301 {

```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```

1302   { \PitonStyle { Name.Function } { #1 } }

```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```

1303   \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1304   { \PitonStyle { UserFunction } }

```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`**.

```

1305   \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1306   { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1307   \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }

```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```

1308   \seq_if_in:NVF \g_@@_languages_seq \l_piton_language_str
1309   { \seq_gput_left:NV \g_@@_languages_seq \l_piton_language_str }
1310 }

```

```

1311 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1312 {
1313   \tl_if_no_value:nTF { #1 }

```

If the command is used without its optional argument, we will deleted the user language for all the informatic languages.

```

1314   { \@@_clear_all_functions: }
1315   { \@@_clear_list_functions:n { #1 } }
1316 }

1317 \cs_new_protected:Npn \@@_clear_list_functions:n #1
1318 {
1319   \clist_set:Nn \l_tmpa_clist { #1 }
1320   \clist_map_function:NN \l_tmpa_clist \@@_clear_functions_i:n
1321   \clist_map_inline:nn { #1 }
1322   { \seq_gremove_all:Nn \g_@@_languages_seq { ##1 } }
1323 }

1324 \cs_new_protected:Npn \@@_clear_functions_i:n #1
1325 { \exp_args:Ne \@@_clear_functions_ii:n { \str_lowercase:n { #1 } } }

```

The following command clears the list of the user-defined functions for the language provided in argument (mandatory in lower case).

```

1326 \cs_new_protected:Npn \@@_clear_functions_ii:n #1
1327 {
1328   \seq_if_exist:cT { g_@@_functions _ #1 _ seq }
1329   {
1330     \seq_map_inline:cn { g_@@_functions _ #1 _ seq }
1331     { \cs_undefine:c { PitonIdentifier _ #1 _ ##1 } }
1332     \seq_gclear:c { g_@@_functions _ #1 _ seq }
1333   }
1334 }

1335 \cs_new_protected:Npn \@@_clear_functions:n #1
1336 {
1337   \@@_clear_functions_i:n { #1 }
1338   \seq_gremove_all:Nn \g_@@_languages_seq { #1 }
1339 }

```

The following command clears all the user-defined functions for all the informatic languages.

```

1340 \cs_new_protected:Npn \@@_clear_all_functions:
1341 {
1342     \seq_map_function:NN \g_@@_languages_seq \@@_clear_functions_i:n
1343     \seq_gclear:N \g_@@_languages_seq
1344 }

```

1508 \hook_gput_code:nnn { begindocument } { . }
1509 {

```

```

1510 \lua_now:n
1511 {
1512     require ( "piton" )
1513     tex.sprint ( luatexbase.catcodetables.CatcodeTableExpl ,
1514                 "\\\@_test_version:n {" .. piton_version .. "}" )
1515 }
1516 }

```

#### 10.2.14 Detected commands

```

1517 \ExplSyntaxOff
1518 \begin{luacode*}
1519 lpeg.locale(lpeg)
1520 local P , alpha , C , space , S , V
1521 = lpeg.P , lpeg.alpha , lpeg.C , lpeg.space , lpeg.S , lpeg.V
1522 local function add(...)
1523     local s = P ( false )
1524     for _ , x in ipairs({...}) do s = s + x end
1525     return s
1526 end
1527 local my_lpeg =
1528 P { "E" ,
1529     E = ( V "F" * ( "," * V "F" ) ^ 0 ) / add ,

```

Be careful: in Lua, `/` has no priority over `*`. Of course, we want a behaviour for this comma-separated list equal to the behaviour of a `clist` of L3.

```

1530     F = space ^ 0 * ( ( alpha ^ 1 ) / "\\\%0" ) * space ^ 0
1531 }
1532 function piton.addListCommands( key_value )
1533     piton.ListCommands = piton.ListCommands + my_lpeg : match ( key_value )
1534 end
1535 \end{luacode*}
1536 
```

### 10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1537 (*LUA)
1538 if piton.comment_latex == nil then piton.comment_latex = ">" end
1539 piton.comment_latex = "#" .. piton.comment_latex

```

The following functions are an easy way to safely insert braces (`{` and `}`) in the TeX flow.

```

1540 function piton.open_brace ()
1541     tex.sprint("{")
1542 end
1543 function piton.close_brace ()
1544     tex.sprint("}")
1545 end
1546 local function sprintL3 ( s )
1547     tex.sprint ( luatexbase.catcodetables.expl , s )
1548 end
1549 % \end{uncoverenv}
1550 %
1551 % \bigskip
1552 % \subsubsection{Special functions dealing with LPEG}
1553 %
1554 % \medskip
1555 % We will use the Lua library \pkg{lpeg} which is built in LuaTeX. That's why we
1556 % define first aliases for several functions of that library.

```

```

1557 % \begin{macrocode}
1558 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1559 local Cs, Cg, Cmt, Cb = lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1560 local R = lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it’s suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```

1561 local function Q ( pattern )
1562     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1563 end

```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It’s suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won’t be much used.

```

1564 local function L ( pattern )
1565     return Ct ( C ( pattern ) )
1566 end

```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that’s the main job of `piton`). That function, unlike the previous one, will be widely used.

```

1567 local function Lc ( string )
1568     return Cc ( { luatexbase.catcodetables.expl , string } )
1569 end

```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```

1570 e
1571 local function K ( style , pattern )
1572     return
1573         Lc ( "{\\PitonStyle{" .. style .. "}" .. )
1574         * Q ( pattern )
1575         * Lc "}"
1576 end

```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```

1577 local function WithStyle ( style , pattern )
1578     return
1579         Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}" .. ) * Cc "}" .. )
1580         * pattern
1581         * Ct ( Cc "Close" )
1582 end

```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```

1583 Escape = P ( false )
1584 EscapeClean = P ( false )
1585 if piton.begin_escape ~= nil
1586 then
1587   Escape =
1588     P ( piton.begin_escape )
1589     * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1590     * P ( piton.end_escape )

```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

1591 EscapeClean =
1592   P ( piton.begin_escape )
1593   * ( 1 - P ( piton.end_escape ) ) ^ 1
1594   * P ( piton.end_escape )
1595 end

1596 EscapeMath = P ( false )
1597 if piton.begin_escape_math ~= nil
1598 then
1599   EscapeMath =
1600     P ( piton.begin_escape_math )
1601     * Lc "\\ensuremath{"
1602     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1603     * Lc ( "}" )
1604     * P ( piton.end_escape_math )
1605 end

```

The following line is mandatory.

```
1606 lpeg.locale(lpeg)
```

## The basic syntactic LPEG

```

1607 local alpha , digit = lpeg.alpha , lpeg.digit
1608 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because `lpeg` is not Unicode-aware.

```

1609 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1610           + "ô" + "û" + "ü" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1611           + "î" + "ï" + "ô" + "û" + "ü"
1612
1613 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1614 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1615 local Identifier = K ( 'Identifier' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the

second argument of the function K. By convention, we use single quotes for delimiting the Lua strings which are names of piton styles (but this is only a convention).

```

1616 local Number =
1617   K ( 'Number' ,
1618     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1619       + digit ^ 0 * P "." * digit ^ 1
1620       + digit ^ 1 )
1621     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1622     + digit ^ 1
1623   )

```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

1624 local Word
1625 if piton.begin_escape then
1626   if piton.begin_escape_math then
1627     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1628                 - piton.begin_escape_math - piton.end_escape_math
1629                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1630   else
1631     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1632                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1633   end
1634 else
1635   if piton.begin_escape_math then
1636     Word = Q ( ( 1 - space - piton.begin_escape_math - piton.end_escape_math
1637                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1638   else
1639     Word = Q ( ( 1 - space - S "'\"\\r[({})]" - digit ) ^ 1 )
1640   end
1641 end

1642 local Space = Q " " ^ 1
1643
1644 local SkipSpace = Q " " ^ 0
1645
1646 local Punct = Q ( S ",,:;!" )
1647
1648 local Tab = "\t" * Lc "\\\l_@_tab_t1"

1649 local SpaceIndentation = Lc "\\@@_an_indentation_space:" * Q " "
1650 local Delim = Q ( S "[({})]" )

```

The following LPEG catches a space (U+0020) and replace it by `\l_@_space_t1`. It will be used in the strings. Usually, `\l_@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\\\l_@_space_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
1651 local VisualSpace = space * Lc "\\\l_@_space_t1"
```

## Several tools for the construction of the main LPEG

```

1652 local LPEG0 = { }
1653 local LPEG1 = { }
1654 local LPEG2 = { }
1655 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings).

```

1656 local function Compute_braces ( lpeg_string ) return
1657     P { "E" ,
1658         E =
1659             (
1660                 "{"
1661                 +
1662                 lpeg_string
1663                 +
1664                 ( 1 - S "{}" )
1665             ) ^ 0
1666     }
1667 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures).

```

1668 local function Compute_DetectedCommands ( lang , braces ) return
1669     Ct ( Cc "Open"
1670         * C ( piton.ListCommands * P "{" )
1671         * Cc "}"
1672     )
1673     * ( braces / (function ( s ) return LPEG1[lang] : match ( s ) end ) )
1674     * P "}"
1675     * Ct ( Cc "Close" )
1676 end

1677 local function Compute_LPEG_cleaner ( lang , braces ) return
1678     Ct ( ( piton.ListCommands * "{"
1679         * ( braces
1680             / ( function ( s ) return LPEG_cleaner[lang] : match ( s ) end ) )
1681             * "}"
1682             + EscapeClean
1683             + C ( P ( 1 ) )
1684         ) ^ 0 ) / table.concat
1685 end

```

**Constructions for Beamer** If the class Beamer is used, some environments and commands of Beamer are automatically detected in the listings of piton.

```

1686 local Beamer = P ( false )
1687 local BeamerBeginEnvironments = P ( true )
1688 local BeamerEndEnvironments = P ( true )

1689 local list_beamer_env =
1690     { "uncoverenv" , "onlyenv" , "visibleenv" ,
1691         "invisibleenv" , "alertenv" , "actionenv" }

```

```

1692 local BeamerNamesEnvironments = P ( false )
1693 for _, x in ipairs ( list_beamer_env ) do
1694     BeamerNamesEnvironments = BeamerNamesEnvironments + x
1695 end

1696 BeamerBeginEnvironments =
1697     ( space ^ 0 *
1698         L
1699         (
1700             P "\begin{" * BeamerNamesEnvironments * "}"
1701             * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1702         )
1703         * "\r"
1704     ) ^ 0

1705 BeamerEndEnvironments =
1706     ( space ^ 0 *
1707         L ( P "\end{" * BeamerNamesEnvironments * "}" )
1708         * "\r"
1709     ) ^ 0

```

The following Lua function will be used to compute the LPEG Beamer for each informatic language.

```
1710 local function Compute_Beamer ( lang , braces )
```

We will compute in lpeg the LPEG that we will return.

```

1711 local lpeg = L ( P "\pause" * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1712 lpeg = lpeg +
1713     Ct ( Cc "Open"
1714         * C ( ( P "\uncover" + "\only" + "\alert" + "\visible"
1715             + "\invisible" + "\action" )
1716             * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1717             * P "{"
1718         )
1719         * Cc "}"
1720     )
1721     * ( braces / ( function ( s ) return LPEG1[lang] : match ( s ) end ) )
1722     * "}"
1723     * Ct ( Cc "Close" )

```

For the command \alt, the specification of the overlays (between angular brackets) is mandatory.

```

1724 lpeg = lpeg +
1725     L ( P "\alt" * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1726     * K ( 'ParseAgain.noCR' , braces )
1727     * L ( P "}{" )
1728     * K ( 'ParseAgain.noCR' , braces )
1729     * L ( P "}" )

```

For \temporal, the specification of the overlays (between angular brackets) is mandatory.

```

1730 lpeg = lpeg +
1731     L ( ( P "\temporal" ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1732     * K ( 'ParseAgain.noCR' , braces )
1733     * L ( P "}{" )
1734     * K ( 'ParseAgain.noCR' , braces )
1735     * L ( P "}{" )
1736     * K ( 'ParseAgain.noCR' , braces )
1737     * L ( P "}" )

```

Now, the environments of Beamer.

```

1738   for _, x in ipairs ( list_beamer_env ) do
1739     lpeg = lpeg +
1740       Ct ( Cc "Open"
1741         * C (
1742           P ( "\begin{" .. x .. "}" )
1743           * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1744         )
1745         * Cc ( "\end{" .. x .. "}" )
1746       )
1747     * (
1748       ( ( 1 - P ( "\end{" .. x .. "}" ) ) ^ 0 )
1749         / ( function ( s ) return LPEG1[lang] : match ( s ) end )
1750       )
1751     * P ( "\end{" .. x .. "}" )
1752     * Ct ( Cc "Close" )
1753   end

```

Now, you can return the value we have computed.

```

1754   return lpeg
1755 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1756 local CommentMath =
1757   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

**EOL** The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```

1758 local PromptHastyDetection =
1759   ( # ( P ">>>" + "..." ) * Lc '\@@_prompt:' ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1760 local Prompt = K ( 'Prompt' , ( ( P ">>>" + "..." ) * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1761 local EOL =
1762   P "\r"
1763   *
1764   (
1765     ( space ^ 0 * -1 )
1766     +

```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>34</sup>.

```

1767   Ct (
1768     Cc "EOL"
1769     *
1770     Ct (

```

---

<sup>34</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

1771     Lc "\\@@_end_line:"
1772     * BeamerEndEnvironments
1773     * BeamerBeginEnvironments
1774     * PromptHastyDetection
1775     * Lc "\\@@_newline: \\@@_begin_line:"
1776     * Prompt
1777   )
1778 )
1779 )
1780 * ( SpaceIndentation ^ 0 * # ( 1 - S "\r" ) ) ^ -1

```

The following LPEG CommentLaTeX is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function C) in a table (by using Ct, which is an alias for lpeg.Ct).

```

1781 local CommentLaTeX =
1782   P(piton.comment_latex)
1783   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
1784   * L ( ( 1 - P "\r" ) ^ 0 )
1785   * Lc "}"}
1786   * ( EOL + -1 )

```

### 10.3.1 The language Python

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1787 local Operator =
1788   K ( 'Operator' ,
1789     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"

1837 "RecursionError" )

1838
1839
1840 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("
1841
1842
1843 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
1843 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

1844 local DefClass =
1845   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style Name.Namespace.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```

1846 local ImportAs =
1847   K ( 'Keyword' , "import" )
1848   * Space
1849   * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1850   *
1851     ( Space * K ( 'Keyword' , "as" ) * Space
1852       * K ( 'Name.Namespace' , identifier ) )
1853     +
1854     ( SkipSpace * Q "," * SkipSpace
1855       * K ( 'Name.Namespace' , identifier ) ) ^ 0
1856   )

```

Be careful: there is no commutativity of + in the previous expression.

The LPEG FromImport is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style Name.Namespace and the following keyword `import` must be formatted with the piton style Keyword and must *not* be caught by the LPEG ImportAs.

Example: `from math import pi`

```
1857 local FromImport =
1858     K ( 'Keyword' , "from" )
1859     * Space * K ( 'Name.Namespace' , identifier )
1860     * Space * K ( 'Keyword' , "import" )
```

**The strings of Python** For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction<sup>35</sup> in that interpolation:

```
f'Total price: {total+1:.2f} €'
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```
1861 local PercentInterpol =
1862     K ( 'String.Interpol' ,
1863         P "%"
1864         * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1865         * ( S "-#0 +" ) ^ 0
1866         * ( digit ^ 1 + "*" ) ^ -1
1867         * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1868         * ( S "HIL" ) ^ -1
1869         * S "sdfFeExXorgiGauc%"
```

)

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.<sup>36</sup>

```
1871 local SingleShortString =
1872     WithStyle ( 'String.Short' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
1873     Q ( P "f!" + "F!" )
1874     *
1875         K ( 'String.Interpol' , "{"
1876             * K ( 'Interpol.Inside' , ( 1 - S "}:" ) ^ 0 )
1877             * Q ( P ":" * ( 1 - S "}:" ) ^ 0 ) ^ -1
1878             * K ( 'String.Interpol' , "}" )
1879             +
1880             VisualSpace
1881             +
1882             Q ( ( P "\\" + "{{" + "}" ) + 1 - S " {" ) ^ 1 )
1883         ) ^ 0
1884         * Q "!"
```

+

---

<sup>35</sup>There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

<sup>36</sup>The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by piton.

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
1886 Q ( P "" + "r" + "R" )
1887 * ( Q ( ( P "\\" + 1 - S " \r%" ) ^ 1 )
1888     + VisualSpace
1889     + PercentInterpol
1890     + Q "%"
1891     ) ^ 0
1892 * Q """
1893
1894
1895
1896 local DoubleShortString =
1897   WithStyle ( 'String.Short' ,
1898     Q ( P "f\"" + "F\"")
1899     *
2000       K ( 'String.Interpol' , "{}")
2001       * K ( 'Interpol.Inside' , ( 1 - S "}":") ^ 0 )
2002       * ( K ( 'String.Interpol' , ":" ) * Q ( (1 - S "}:\") ^ 0 ) ) ^ -1
2003       * K ( 'String.Interpol' , "}" )
2004     +
2005       VisualSpace
2006     +
2007       Q ( ( P "\\\\" + "{{" + "}" }" + 1 - S " {}\"") ^ 1 )
2008     ) ^ 0
2009 * Q """
2010 +
2011   Q ( P "\\" + "r\\"" + "R\\"")
2012 * ( Q ( ( P "\\\\" + 1 - S " \"\r%" ) ^ 1 )
2013     + VisualSpace
2014     + PercentInterpol
2015     + Q "%"
2016     ) ^ 0
2017 * Q """
2018
2019 local ShortString = SingleShortString + DoubleShortString
```

## Beamer

```
1920 local braces =
1921   Compute_braces
1922   (
1923     Q ( P "\\" + "r\\"" + "R\\"" + "f\\"" + "F\\"")
1924     * ( "\\" * ( P "\\\\" + 1 - S "\\" ) ^ 0 * "\\" )
1925   +
1926     Q ( P '\'' + 'r\'' + 'R\'' + 'f\'' + 'F\'' )
1927     * ( '\'' * ( P '\\\\' + 1 - S '\'' ) ^ 0 * '\'' )
1928   )
1929 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end
```

## Detected commands

```
1930 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
```

## LPEG\_cleaner

```
1931 LPEG_cleaner['python'] = Compute_LPEG_cleaner ( 'python' , braces )
```

## The long strings

```
1932 local SingleLongString =
1933   WithStyle ( 'String.Long' ,
1934     ( Q ( S "fF" * P "****" )
1935       *
1936         K ( 'String.Interpol' , "{}" )
1937         * K ( 'Interpol.Inside' , ( 1 - S "}:\\r" - "****" ) ^ 0 )
1938         * Q ( P ":" * (1 - S "}:\\r" - "****" ) ^ 0 ) ^ -1
1939         * K ( 'String.Interpol' , "}" )
1940         +
1941         Q ( ( 1 - P "****" - S "{}\\r" ) ^ 1 )
1942         +
1943         EOL
1944       ) ^ 0
1945     +
1946     Q ( ( S "rR" ) ^ -1 * "****" )
1947     *
1948       Q ( ( 1 - P "****" - S "\\r%" ) ^ 1 )
1949       +
1950       PercentInterpol
1951       +
1952       P "%"
1953       +
1954       EOL
1955     ) ^ 0
1956   )
1957   * Q "****" )
1958
1959
1960 local DoubleLongString =
1961   WithStyle ( 'String.Long' ,
1962   (
1963     Q ( S "fF" * "\\\"\\\"")
1964     *
1965       K ( 'String.Interpol' , "{}" )
1966       * K ( 'Interpol.Inside' , ( 1 - S "}:\\r" - "\\\"\\\"" ) ^ 0 )
1967       * Q ( ":" * (1 - S "}:\\r" - "\\\"\\\"" ) ^ 0 ) ^ -1
1968       * K ( 'String.Interpol' , "}" )
1969       +
1970       Q ( ( 1 - S "{}\\r" - "\\\"\\\"" ) ^ 1 )
1971       +
1972       EOL
1973     ) ^ 0
1974   +
1975   Q ( S "rR" ^ -1 * "\\\"\\\"")
1976   *
1977     Q ( ( 1 - P "\\\"\\\"" - S "%\\r" ) ^ 1 )
1978     +
1979     PercentInterpol
1980     +
1981     P "%"
1982     +
1983     EOL
1984   ) ^ 0
1985   )
1986   * Q "\\\"\\\""
1987 )
1988 local LongString = SingleLongString + DoubleLongString
```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG `DefFunction` which deals with the whole preamble of a function definition (which begins with `def`).

```
1989 local StringDoc =
```

```

1990 K ( 'String.Doc' , P "r" ^ -1 * "\\"\\\"\\\" )
1991 * ( K ( 'String.Doc' , (1 - P "\\"\\\"\\\" - "\r" ) ^ 0 ) * EOL
1992     * Tab ^ 0
1993     ) ^ 0
1994 * K ( 'String.Doc' , ( 1 - P "\\"\\\"\\\" - "\r" ) ^ 0 * "\\"\\\"\\\" )

```

**The comments in the Python listings** We define different LPEG dealing with comments in the Python listings.

```

1995 local Comment =
1996   WithStyle ( 'Comment' ,
1997     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
1998     * ( EOL + -1 )

```

**DefFunction** The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

1999 local expression =
2000   P { "E" ,
2001     E = ( "" * ( P "\\\\" + 1 - S "'\r" ) ^ 0 * """
2002       + "\\" * ( P "\\\\" + 1 - S "\\""\r" ) ^ 0 * "\\""
2003       + "{" * V "F" * "}"
2004       + "(" * V "F" * ")"
2005       + "[" * V "F" * "]"
2006       + ( 1 - S "{}()[]\r," ) ) ^ 0 ,
2007     F = (   "{" * V "F" * "}"
2008       + "(" * V "F" * ")"
2009       + "[" * V "F" * "]"
2010       + ( 1 - S "{}()[]\r\"") ) ^ 0
2011   }

```

We will now define a LPEG **Params** that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG **Params** will be used to catch the chunk `a,b,x=10,n:int`.

```

2012 local Params =
2013   P { "E" ,
2014     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2015     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2016     * (
2017       K ( 'InitialValues' , "=" * expression )
2018       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2019     ) ^ -1
2020   }

```

The following LPEG **DefFunction** catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as **Comment**, **CommentLaTeX**, **Params**, **StringDoc**...

```

2021 local DefFunction =
2022   K ( 'Keyword' , "def" )
2023   * Space
2024   * K ( 'Name.Function.Internal' , identifier )
2025   * SkipSpace
2026   * Q "(" * Params * Q ")"
2027   * SkipSpace
2028   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain` which will be linked to `\@@_piton:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

2029 * K ( 'ParseAgain.noCR' , ( 1 - S ":\\r" ) ^ 0 )
2030 * Q ":" 
2031 * ( SkipSpace
2032     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2033     * Tab ^ 0
2034     * SkipSpace
2035     * StringDoc ^ 0 -- there may be additional docstrings
2036 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` must appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

## Miscellaneous

```
2037 local ExceptionInConsole = Exception * Q ( ( 1 - P "\\r" ) ^ 0 ) * EOL
```

## The main LPEG for the language Python

First, the main loop :

```

2038 local Main =
2039     space ^ 1 * -1
2040     + space ^ 0 * EOL
2041     + Space
2042     + Tab
2043     + Escape + EscapeMath
2044     + CommentLaTeX
2045     + Beamer
2046     + DetectedCommands
2047     + LongString
2048     + Comment
2049     + ExceptionInConsole
2050     + Delim
2051     + Operator
2052     + OperatorWord * ( Space + Punct + Delim + EOL + -1 )
2053     + ShortString
2054     + Punct
2055     + FromImport
2056     + RaiseException
2057     + DefFunction
2058     + DefClass
2059     + Keyword * ( Space + Punct + Delim + EOL + -1 )
2060     + Decorator
2061     + Builtin * ( Space + Punct + Delim + EOL + -1 )
2062     + Identifier
2063     + Number
2064     + Word

```

Here, we must not put `local`!

```
2065 LPEG1['python'] = Main ^ 0
```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>37</sup>.

```

2066 LPEG2['python'] =
2067     Ct (

```

---

<sup>37</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2068     ( space ^ 0 * "\r" ) ^ -1
2069     * BeamerBeginEnvironments
2070     * PromptHastyDetection
2071     * Lc '\\@@_begin_line:'
2072     * Prompt
2073     * SpaceIndentation ^ 0
2074     * LPEG1['python']
2075     * -1
2076     * Lc '\\@@_end_line:'
2077 )

```

### 10.3.2 The language Ocaml

```

2078 local Delim = Q ( P "[" + "|" ]" + S "[()]" )
2079 local Punct = Q ( S ",::;!" )

```

The identifiers caught by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

2080 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2081 local Constructor = K ( 'Name.Constructor' , cap_identifier )
2082 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

2083 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2084 local Identifier = K ( 'Identifier' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

2085 local expression_for_fields =
2086   P { "E" ,
2087     E = (   "{ " * V "F" * "}" "
2088       + "(" * V "F" * ")"
2089       + "[" * V "F" * "]"
2090       + "\\" * ( P "\\\\" + 1 - S "\r" ) ^ 0 * "\\" "
2091       + "' " * ( P "\\'" + 1 - S "'\r" ) ^ 0 * "' "
2092       + ( 1 - S "{}()[]\r;" ) ) ^ 0 ,
2093     F = (   "{ " * V "F" * "}" "
2094       + "(" * V "F" * ")"
2095       + "[" * V "F" * "]"
2096       + ( 1 - S "{}()[]\r\'\'") ) ^ 0
2097   }
2098 local OneFieldDefinition =
2099   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2100   * K ( 'Name.Field' , identifier ) * SkipSpace
2101   * Q ":" * SkipSpace
2102   * K ( 'Name.Type' , expression_for_fields )
2103   * SkipSpace
2104
2105 local OneField =
2106   K ( 'Name.Field' , identifier ) * SkipSpace
2107   * Q "=" * SkipSpace
2108   * ( expression_for_fields
2109     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2110   )
2111   * SkipSpace
2112
2113 local Record =
2114   Q "{}" * SkipSpace
2115   *
2116   (
2117     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
2118     +
2119     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0

```

```

2120      )
2121      *
2122      Q "}""

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2123 local DotNotation =
2124 (
2125     K ( 'Name.Module' , cap_identifier )
2126     * Q "."
2127     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{"
2128     +
2129     Identifier
2130     * Q "."
2131     * K ( 'Name.Field' , identifier )
2132 )
2133 * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0
2134 local Operator =
2135     K ( 'Operator' ,
2136         P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "| |" + "&&" +
2137         "///" + "**" + ";" + ":" + "->" + "+" + "-" + "*" + "/"
2138         + S "--+/*%=<>&@| "
2139
2140 local OperatorWord =
2141     K ( 'Operator.Word' ,
2142         P "and" + "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )
2143
2144 local Keyword =
2145     K ( 'Keyword' ,
2146         P "assert" + "and" + "as" + "begin" + "class" + "constraint" + "done"
2147         + "downto" + "do" + "else" + "end" + "exception" + "external" + "for" +
2148         "function" + "functor" + "fun" + "if" + "include" + "inherit" + "initializer"
2149         + "in" + "lazy" + "let" + "match" + "method" + "module" + "mutable" + "new" +
2150         "object" + "of" + "open" + "private" + "raise" + "rec" + "sig" + "struct" +
2151         "then" + "to" + "try" + "type" + "value" + "val" + "virtual" + "when" +
2152         "while" + "with" )
2153     + K ( 'Keyword.Constant' , P "true" + "false" )
2154
2155 local Builtin =
2156     K ( 'Name.Builtin' , P "not" + "incr" + "decr" + "fst" + "snd" )

```

The following exceptions are exceptions in the standard library of OCaml (Stdlib).

```

2157 local Exception =
2158     K ( 'Exception' ,
2159         P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
2160         "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
2161         "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )

```

## The characters in OCaml

```

2162 local Char =
2163     K ( 'String.Short' , "" * ( ( 1 - P "" ) ^ 0 + "\\" ) * "" )

```

## Beamer

```

2164 braces = Compute_braces ( "" * ( 1 - S "" ) ^ 0 * "" )
2165 if piton.beamer then
2166     Beamer = Compute_Beamer ( 'ocaml' , "" * ( 1 - S "" ) ^ 0 * "" )
2167 end
2168 DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )

```

```
2169 LPEG_cleaner['ocaml'] = Compute_LPEG_cleaner ( 'ocaml' , braces )
```

**The strings en OCaml** We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```
2170 local ocaml_string =
2171     Q "\\""
2172     *
2173     VisualSpace
2174     +
2175     Q ( ( 1 - S " \r" ) ^ 1 )
2176     +
2177     EOL
2178     ) ^ 0
2179     * Q "\\""
2180 local String = WithStyle ( 'String.Long' , ocaml_string )
```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in [www.inf.puc-rio.br/~roberto/lpeg](http://www.inf.puc-rio.br/~roberto/lpeg).

```
2181 local ext = ( R "az" + "_" ) ^ 0
2182 local open = "{" * Cg ( ext , 'init' ) * "|"
2183 local close = "|" * C ( ext ) * "}"
2184 local closeeq =
2185     Cmt ( close * Cb ( 'init' ) ,
2186             function ( s , i , a , b ) return a == b end )
```

The `LPEG_QuotedStringBis` will do the second analysis.

```
2187 local QuotedStringBis =
2188     WithStyle ( 'String.Long' ,
2189     (
2190         Space
2191         +
2192         Q ( ( 1 - S " \r" ) ^ 1 )
2193         +
2194         EOL
2195     ) ^ 0 )
```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```
2196 local QuotedString =
2197     C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2198     ( function ( s ) return QuotedStringBis : match ( s ) end )
```

**The comments in the OCaml listings** In OCaml, the delimiters for the comments are `(*` and `*)`. There are unsymmetrical and OCaml allows those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between `$` and `$`) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```
2199 local Comment =
2200     WithStyle ( 'Comment' ,
2201     P {
2202         "A" ,
2203         A = Q "(*"
2204         * ( V "A"
2205             + Q ( ( 1 - S "\r$\\" - "(* - *)" ) ^ 1 ) -- $
```

```

2206      + ocaml_string
2207      + $" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * $" -- $
2208      + EOL
2209      ) ^ 0
2210      * Q "*)"
2211  }
)

```

## The DefFunction

```

2212 local balanced_parens =
2213   P { "E" , E = ( "(" * V "E" * ")" + 1 - S "()" ) ^ 0 }
2214 local Argument =
2215   K ( 'Identifier' , identifier )
2216   + Q "(" * SkipSpace
2217   * K ( 'Identifier' , identifier ) * SkipSpace
2218   * Q ":" * SkipSpace
2219   * K ( 'Name.Type' , balanced_parens ) * SkipSpace
2220   * Q ")"
2221

```

Despite its name, then LPEG DefFunction deals also with `let open` which opens locally a module.

```

2221 local DefFunction =
2222   K ( 'Keyword' , "let open" )
2223   * Space
2224   * K ( 'Name.Module' , cap_identifier )
2225   +
2226   K ( 'Keyword' , P "let rec" + "let" + "and" )
2227   * Space
2228   * K ( 'Name.Function.Internal' , identifier )
2229   * Space
2230   * (
2231     Q "=" * SkipSpace * K ( 'Keyword' , "function" )
2232     +
2233     Argument
2234     * ( SkipSpace * Argument ) ^ 0
2235     * (
2236       SkipSpace
2237       * Q ":" *
2238       * K ( 'Name.Type' , ( 1 - P "=" ) ^ 0 )
2239       ) ^ -1
2240     )
)

```

**The DefModule** The following LPEG will be used in the definitions of modules but also in the definitions of *types* of modules.

```

2241 local DefModule =
2242   K ( 'Keyword' , "module" ) * Space
2243   *
2244   (
2245     K ( 'Keyword' , "type" ) * Space
2246     * K ( 'Name.Type' , cap_identifier )
2247   +
2248     K ( 'Name.Module' , cap_identifier ) * SkipSpace
2249     *
2250     (
2251       Q "(" * SkipSpace
2252       * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2253       * Q ":" * SkipSpace
2254       * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2255       *
2256       (
2257         Q "," * SkipSpace

```

```

2258             * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2259             * Q ":" * SkipSpace
2260             * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2261             ) ^ 0
2262             * Q ")"
2263             ) ^ -1
2264             *
2265             (
2266             Q "=" * SkipSpace
2267             * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2268             * Q "("
2269             * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2270             *
2271             (
2272             Q ","
2273             *
2274             K ( 'Name.Module' , cap_identifier ) * SkipSpace
2275             ) ^ 0
2276             * Q ")"
2277             ) ^ -1
2278         )
2279         +
2280     K ( 'Keyword' , P "include" + "open" )
2281     * Space * K ( 'Name.Module' , cap_identifier )

```

### The parameters of the types

```
2282 local TypeParameter = K ( 'TypeParameter' , """ * alpha * # ( 1 - P """ ) )
```

### The main LPEG for the language OCaml First, the main loop :

```

2283 local Main =
2284     space ^ 1 * -1
2285     + space ^ 0 * EOL
2286     + Space
2287     + Tab
2288     + Escape + EscapeMath
2289     + Beamer
2290     + DetectedCommands
2291     + TypeParameter
2292     + String + QuotedString + Char
2293     + Comment
2294     + Delim
2295     + Operator
2296     + Punct
2297     + FromImport
2298     + Exception
2299     + DefFunction
2300     + DefModule
2301     + Record
2302     + Keyword * ( Space + Punct + Delim + EOL + -1 )
2303     + OperatorWord * ( Space + Punct + Delim + EOL + -1 )
2304     + Builtin * ( Space + Punct + Delim + EOL + -1 )
2305     + DotNotation
2306     + Constructor
2307     + Identifier
2308     + Number
2309     + Word
2310
2311 LPEG1['ocaml'] = Main ^ 0

```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>38</sup>.

```

2312 LPEG2['ocaml'] =
2313   Ct (
2314     ( space ^ 0 * "\r" ) ^ -1
2315     * BeamerBeginEnvironments
2316     * Lc '\@@_begin_line:'
2317     * SpaceIndentation ^ 0
2318     * LPEG1['ocaml']
2319     * -1
2320     * Lc '\@@_end_line:'
2321   )

```

### 10.3.3 The language C

```

2322 local Delim = Q ( S "{[()]}"
2323 local Punct = Q ( S ",;:;" )

```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2324 local identifier = letter * alphanum ^ 0
2325
2326 local Operator =
2327   K ( 'Operator' ,
2328     P "!=" + "==" + "<<" + ">>" + "<=" + ">=" + "||" + "&&"
2329     + S "--+/*%=>&.@|!" )
2330
2331 local Keyword =
2332   K ( 'Keyword' ,
2333     P "alignas" + "asm" + "auto" + "break" + "case" + "catch" + "class" +
2334     "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +
2335     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +
2336     "register" + "restricted" + "return" + "static" + "static_assert" +
2337     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +
2338     "union" + "using" + "virtual" + "volatile" + "while"
2339   )
2340   + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )
2341
2342 local Builtin =
2343   K ( 'Name.Builtin' ,
2344     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )
2345
2346 local Type =
2347   K ( 'Name.Type' ,
2348     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +
2349     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2350     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0
2351
2352 local DefFunction =
2353   Type
2354   * Space
2355   * Q "*" ^ -1
2356   * K ( 'Name.Function.Internal' , identifier )
2357   * SkipSpace
2358   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

---

<sup>38</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```
2359 local DefClass =
2360   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

## The strings of C

```
2361 String =
2362   WithStyle ( 'String.Long' ,
2363     Q "\""
2364     * ( VisualSpace
2365       + K ( 'String.Interpol' ,
2366         "%" * ( S "difcspxYou" + "ld" + "li" + "hd" + "hi" )
2367         )
2368       + Q ( ( P "\\\\" + 1 - S " \"\\"" ) ^ 1 )
2369     ) ^ 0
2370   * Q "\""
2371 )
```

## Beamer

```
2372 braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2373 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2374 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2375 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )
```

## The directives of the preprocessor

```
2376 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )
```

**The comments in the C listings** We define different LPEG dealing with comments in the C listings.

```
2377 local Comment =
2378   WithStyle ( 'Comment' ,
2379     Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2380     * ( EOL + -1 )
2381
2382 local LongComment =
2383   WithStyle ( 'Comment' ,
2384     Q "/*"
2385     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2386     * Q "*/"
2387   ) -- $
```

**The main LPEG for the language C** First, the main loop :

```

2388 local Main =
2389     space ^ 1 * -1
2390     + space ^ 0 * EOL
2391     + Space
2392     + Tab
2393     + Escape + EscapeMath
2394     + CommentLaTeX
2395     + Beamer
2396     + DetectedCommands
2397     + Preproc
2398     + Comment + LongComment
2399     + Delim
2400     + Operator
2401     + String
2402     + Punct
2403     + DefFunction
2404     + DefClass
2405     + Type * ( Q "*" ^ -1 + Space + Punct + Delim + EOL + -1 )
2406     + Keyword * ( Space + Punct + Delim + EOL + -1 )
2407     + Builtin * ( Space + Punct + Delim + EOL + -1 )
2408     + Identifier
2409     + Number
2410     + Word

```

Here, we must not put `local!`

```
2411 LPEG1['c'] = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@_begin_line: - \@_end_line:`<sup>39</sup>.

```

2412 LPEG2['c'] =
2413 Ct (
2414     ( space ^ 0 * P "\r" ) ^ -1
2415     * BeamerBeginEnvironments
2416     * Lc '\@_begin_line:'
2417     * SpaceIndentation ^ 0
2418     * LPEG1['c']
2419     * -1
2420     * Lc '\@_end_line:'
2421 )

```

#### 10.3.4 The language SQL

```

2422 local function LuaKeyword ( name )
2423 return
2424     Lc [[{\PitonStyle{Keyword}{}}
2425     * Q ( Cmt (
2426         C ( identifier ) ,
2427         function ( s , i , a ) return string.upper ( a ) == name end
2428     )
2429     )
2430     * Lc "}}"
2431 end

```

In the identifiers, we will be able to catch those containing spaces, that is to say like `"last name"`.

```

2432 local identifier =
2433     letter * ( alphanum + "-" ) ^ 0

```

---

<sup>39</sup>Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2434     + '"" * ( ( alphanum + space - '"" ) ^ 1 ) * '""  

2435  

2436  

2437 local Operator =  

2438 K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )  

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch  

the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However,  

some keywords will be caught in special LPEG because we want to detect the names of the SQL  

tables.  

2439 local function Set ( list )  

2440   local set = { }  

2441   for _, l in ipairs ( list ) do set[l] = true end  

2442   return set  

2443 end  

2444  

2445 local set_keywords = Set  

2446 {  

2447   "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,  

2448   "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,  

2449   "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,  

2450   "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,  

2451   "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,  

2452   "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"  

2453 }  

2454  

2455 local set_builtins = Set  

2456 {  

2457   "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,  

2458   "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,  

2459   "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"  

2460 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2461 local Identifier =  

2462   C ( identifier ) /  

2463   (  

2464     function (s)  

2465       if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL  

Remind that, in Lua, it's possible to return several values.  

2466       then return { {"\\PitonStyle{Keyword}"} ,  

2467                     { luatexbase.catcodetables.other , s } ,  

2468                     { "}" } }  

2469     else if set_builtins[string.upper(s)]  

2470       then return { {"\\PitonStyle{Name.Builtin}"} ,  

2471                     { luatexbase.catcodetables.other , s } ,  

2472                     { "}" } }  

2473     else return { {"\\PitonStyle{Name.Field}"} ,  

2474                     { luatexbase.catcodetables.other , s } ,  

2475                     { "}" } }  

2476   end  

2477 end  

2478 end  

2479 )

```

## The strings of SQL

```

2480 local String = K ( 'String.Long' , '"" * ( 1 - P "" ) ^ 1 * "" )
```

## Beamer

```
2481 braces = Compute_braces ( String )
2482 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
2483 DetectedCommands = Compute_DetectedCommands ( 'sql' , braces )
2484 LPEG_cleaner['sql'] = Compute_LPEG_cleaner ( 'sql' , braces )
```

**The comments in the SQL listings** We define different LPEG dealing with comments in the SQL listings.

```
2485 local Comment =
2486   WithStyle ( 'Comment' ,
2487     Q "--" -- syntax of SQL92
2488     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2489     * ( EOL + -1 )
2490
2491 local LongComment =
2492   WithStyle ( 'Comment' ,
2493     Q "/*"
2494     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2495     * Q "*/"
2496   ) -- $
```

## The main LPEG for the language SQL

```
2497 local TableField =
2498   K ( 'Name.Table' , identifier )
2499   * Q "."
2500   * K ( 'Name.Field' , identifier )
2501
2502 local OneField =
2503   (
2504     Q ( "(" * ( 1 - P ")" ) ^ 0 * ")" )
2505     +
2506     K ( 'Name.Table' , identifier )
2507     * Q "."
2508     * K ( 'Name.Field' , identifier )
2509     +
2510     K ( 'Name.Field' , identifier )
2511   )
2512   *
2513   Space * LuaKeyword "AS" * Space * K ( 'Name.Field' , identifier )
2514   ) ^ -1
2515   * ( Space * ( LuaKeyword "ASC" + LuaKeyword "DESC" ) ) ^ -1
2516
2517 local OneTable =
2518   K ( 'Name.Table' , identifier )
2519   *
2520   Space
2521   * LuaKeyword "AS"
2522   * Space
2523   * K ( 'Name.Table' , identifier )
2524   ) ^ -1
2525
2526 local WeCatchTableNames =
2527   LuaKeyword "FROM"
2528   * ( Space + EOL )
2529   * OneTable * ( SkipSpace * Q "," * SkipSpace * OneTable ) ^ 0
2530   +
2531   LuaKeyword "JOIN" + LuaKeyword "INTO" + LuaKeyword "UPDATE"
2532   + LuaKeyword "TABLE"
```

```

2533     )
2534     * ( Space + EOL ) * OneTable

```

First, the main loop :

```

2535 local Main =
2536     space ^ 1 * -1
2537     + space ^ 0 * EOL
2538     + Space
2539     + Tab
2540     + Escape + EscapeMath
2541     + CommentLaTeX
2542     + Beamer
2543     + DetectedCommands
2544     + Comment + LongComment
2545     + Delim
2546     + Operator
2547     + String
2548     + Punct
2549     + WeCatchTableNames
2550     + ( TableField + Identifier ) * ( Space + Operator + Punct + Delim + EOL + -1 )
2551     + Number
2552     + Word

```

Here, we must not put local!

```

2553 LPEG1['sql'] = Main ^ 0

```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@_begin_line: - @_end_line:`<sup>40</sup>.

```

2554 LPEG2['sql'] =

2626 % \subsubsection{The function Parse}
2627 %
2628 % \medskip
2629 % The function |Parse| is the main function of the package \pkg{piton}. It
2630 % parses its argument and sends back to LaTeX the code with interlaced
2631 % formatting LaTeX instructions. In fact, everything is done by the
2632 % \textsc{lpeg} corresponding to the considered language (|LPEG2[language]|)
2633 % which returns as capture a Lua table containing data to send to LaTeX.
2634 %
2635 % \bigskip
2636 % \begin{macrocode}
2637 function piton.Parse ( language , code )
2638     local t = LPEG2[language] : match ( code )
2639     if t == nil
2640     then
2641         sprintL3 [[ \@@_error_or_warning:n { syntax~error } ]]
2642         return -- to exit in force the function
2643     end
2644     local left_stack = {}
2645     local right_stack = {}

```

```

2646   for _, one_item in ipairs ( t ) do
2647     if one_item[1] == "EOL" then
2648       for _, s in ipairs ( right_stack ) do
2649         tex.sprint ( s )
2650       end
2651       for _, s in ipairs ( one_item[2] ) do
2652         tex.tprint ( s )
2653       end
2654       for _, s in ipairs ( left_stack ) do
2655         tex.sprint ( s )
2656       end
2657     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{cover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\end{cover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{cover}`.

```

2658   if one_item[1] == "Open" then
2659     tex.sprint( one_item[2] )
2660     table.insert ( left_stack , one_item[2] )
2661     table.insert ( right_stack , one_item[3] )
2662   else
2663     if one_item[1] == "Close" then
2664       tex.sprint ( right_stack[#right_stack] )
2665       left_stack[#left_stack] = nil
2666       right_stack[#right_stack] = nil
2667     else
2668       tex.tprint ( one_item )
2669     end
2670   end
2671 end
2672 end
2673 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputfile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

2674 function piton.ParseFile ( language , name , first_line , last_line , split )
2675   local s = ''
2676   local i = 0
2677   for line in io.lines ( name ) do
2678     i = i + 1
2679     if i >= first_line then
2680       s = s .. '\r' .. line
2681     end
2682     if i >= last_line then break end
2683   end

```

We extract the BOM of utf-8, if present.

```

2684   if string.byte ( s , 1 ) == 13 then
2685     if string.byte ( s , 2 ) == 239 then
2686       if string.byte ( s , 3 ) == 187 then
2687         if string.byte ( s , 4 ) == 191 then
2688           s = string.sub ( s , 5 , -1 )
2689         end
2700       end
2701     end
2702   end
2703   if split == 1 then
2704     piton.GobbleSplitParse ( language , 0 , s )
2705   else
2706     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]

```

```

2697     piton.Parse ( language , s )
2698     sprintL3
2699     [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]
2700   end
2701 end

```

### 10.3.6 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

2702 function piton.ParseBis ( lang , code )
2703   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2704   return piton.Parse ( lang , s )
2705 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2706 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space: ]]` with a space after the name of the LaTeX command `\@@_breakable_space:`.

```

2707   local s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
2708     : match ( code )
2709   return piton.Parse ( lang , s )
2710 end

```

### 10.3.7 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

2711 local AutoGobbleLPEG =
2712   (
2713     P " " ^ 0 * "\r"
2714     +
2715     Ct ( C " " ^ 0 ) / table.getn
2716     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2717   ) ^ 0
2718   * ( Ct ( C " " ^ 0 ) / table.getn
2719     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2720 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

2721 local TabsAutoGobbleLPEG =
2722   (
2723     (
2724       P "\t" ^ 0 * "\r"
2725       +
2726       Ct ( C "\t" ^ 0 ) / table.getn
2727       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2728     ) ^ 0
2729     * ( Ct ( C "\t" ^ 0 ) / table.getn
2730       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2731   ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2732 local EnvGobbleLPEG =
2733   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2734   * Ct ( C " " ^ 0 * -1 ) / table.getn
2735 local function remove_before_cr ( input_string )
2736   local match_result = ( P "\r" ) : match ( input_string )
2737   if match_result then
2738     return string.sub ( input_string , match_result )
2739   else
2740     return input_string
2741   end
2742 end

```

The function `gobble` gobbles  $n$  characters on the left of the code. The negative values of  $n$  have special significations.

```

2743 local function gobble ( n , code )
2744   code = remove_before_cr ( code )
2745   if n == 0 then
2746     return code
2747   else
2748     if n == -1 then
2749       n = AutoGobbleLPEG : match ( code )
2750     else
2751       if n == -2 then
2752         n = EnvGobbleLPEG : match ( code )
2753       else
2754         if n == -3 then
2755           n = TabsAutoGobbleLPEG : match ( code )
2756         end
2757       end
2758     end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2759   if n == 0 then
2760     return code
2761   else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of  $n$ .

```

2762   return
2763   ( Ct (
2764     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2765     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2766     ) ^ 0 )
2767     / table.concat
2768   ) : match ( code )
2769 end
2770 end
2771 end

```

In the following code,  $n$  is the value of `\l_@@_gobble_int`.

```

2772 function piton.GobbleParse ( lang , n , code )
2773   piton.last_code = gobble ( n , code )
2774   piton.last_language = lang
2775   sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2776   piton.Parse ( lang , piton.last_code )
2777   sprintL3
2778   [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]

```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```

2779 if piton.write and piton.write ~= '' then
2780   local file = assert ( io.open ( piton.write , piton.write_mode ) )
2781   file:write ( piton.get_last_code ( ) )
2782   file:close ( )
2783 end
2784 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks.

```

2785 function piton.GobbleSplitParse ( lang , n , code )
2786   P { "E" ,
2787     E = ( V "F"
2788       * ( P " " ^ 0 * "\r"
2789         / ( function ( x ) sprintL3 [[ \@@_incr_visual_line: ]] end )
2790         ) ^ 1
2791         / ( function ( x )
2792           sprintL3 [[ \l_@@_split_separation_t1 \int_gzero:N \g_@@_line_int ]]
2793           end )
2794       ) ^ 0 * V "F" ,

```

The non-terminal F corresponds to a chunk of the informatic code.

```
2795   F = C ( V "G" ^ 0 )
```

The second argument of `.pitonGobbleParse` is the argument `gobble`: we put that argument to 0 because we will have gobbled previously the whole argument `code` (see below).

```
2796   / ( function ( x ) piton.GobbleParse ( lang , 0 , x ) end ) ,
```

The non-terminal G corresponds to a non-empty line of code.

```

2797   G = ( 1 - P "\r" ) ^ 0 * "\r" - ( P " " ^ 0 * "\r" )
2798   } : match ( gobble ( n , code ) )
2799 end

```

The following public Lua function is provided to the developer.

```

2800 function piton.get_last_code ( )
2801   return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2802 end

```

### 10.3.8 To count the number of lines

```

2803 function piton.CountLines ( code )
2804   local count = 0
2805   for i in code : gmatch ( "\r" ) do count = count + 1 end
2806   sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { }] .. count .. '}' )
2807 end
2808 function piton.CountNonEmptyLines ( code )
2809   local count = 0
2810   count =
2811     ( Ct ( ( P " " ^ 0 * "\r"
2812       + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2813       * ( 1 - P "\r" ) ^ 0
2814       * -1
2815     ) / table.getn
2816   ) : match ( code )
2817   sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { }] .. count .. '}' )
2818 end
2819 function piton.CountLinesFile ( name )

```

```

2820 local count = 0
2821 for line in io.lines ( name ) do count = count + 1 end
2822 sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { } ] .. count .. '}' )
2823 end

2824 function piton.CountNonEmptyLinesFile ( name )
2825 local count = 0
2826 for line in io.lines ( name )
2827 do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2828 count = count + 1
2829 end
2830 end
2831 sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { } ] .. count .. '}' )
2832 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2833 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2834 local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2835 local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2836 local first_line = -1
2837 local count = 0
2838 local last_found = false
2839 for line in io.lines ( file_name )
2840 do if first_line == -1
2841 then if string.sub ( line , 1 , #s ) == s
2842 then first_line = count
2843 end
2844 else if string.sub ( line , 1 , #t ) == t
2845 then last_found = true
2846 break
2847 end
2848 end
2849 count = count + 1
2850 end
2851 if first_line == -1
2852 then sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
2853 else if last_found == false
2854 then sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
2855 end
2856 end
2857 sprintL3 (
2858 [[ \int_set:Nn \l_@@_first_line_int { } ] .. first_line .. ' + 2 }
2859 .. [[ \int_set:Nn \l_@@_last_line_int { } ] .. count .. ' } ])
2860 end

```

### 10.3.9 To create new languages with the syntax of listings

```

2861 function piton.new_language ( lang , definition )
2862 lang = string.lower ( lang )

2863 local alpha , digit = lpeg.alpha , lpeg.digit
2864 local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key ) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

2865 function add_to_letter ( c )
2866 if c ~= " " then table.insert ( extra_letters , c ) end
2867 end

```

For the digits, it's straightforward.

```

2868     function add_to_digit ( c )
2869         if c ~= " " then digit = digit + c end
2870     end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `\_` and `\_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

2871     local other = S ":_@+-*/<>!?;.:()~^=#&\\"\\\$" -- $
2872     local extra_others = { }
2873     function add_to_other ( c )
2874         if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```
2875         extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for the language HTML) for the character `/` in the closing tags `</....>`.

```

2876     other = other + P "c"
2877     end
2878 end

```

Of course, the LPEG `strict_braces` is for balanced braces (without the question of strings of an informatic language). In fact, it *won't* be used for an informatic language (as dealt by piton) but for LaTeX instructions;

```

2879     local strict_braces =
2880     P { "E" ,
2881         E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
2882         F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
2883     }

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

2884     local cut_definition =
2885     P { "E" ,
2886         E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
2887         F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
2888                 * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
2889     }
2890     local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of piton is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

2891     local tex_braced_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2892     local tex_arg = tex_braced_arg + C ( 1 )
2893     local tex_option_arg = "[[" * C ( ( 1 - P "]" ) ^ 0 ) * "]]" + Cc ( nil )
2894     local args_for_tag
2895         = tex_option_arg
2896         * space ^ 0
2897         * tex_arg
2898         * space ^ 0
2899         * tex_arg
2900     local args_for_morekeywords
2901         = "[[" * C ( ( 1 - P "]" ) ^ 0 ) * "]]"
2902         * space ^ 0
2903         * tex_option_arg
2904         * space ^ 0
2905         * tex_arg
2906         * space ^ 0

```

```

2907     * ( tex_braced_arg + Cc ( nil ) )
2908 local args_for_moredelims
2909 = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
2910     * args_for_morekeywords
2911 local args_for_morecomment
2912 = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2913     * space ^ 0
2914     * tex_option_arg
2915     * space ^ 0
2916     * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

2917 local sensitive = true
2918 local style_tag , left_tag , right_tag
2919 for _ , x in ipairs ( def_table ) do
2920     if x[1] == "sensitive" then
2921         if x[2] == nil or ( P "true" ) : match ( x[2] ) then
2922             sensitive = true
2923         else
2924             if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
2925         end
2926     end
2927     if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
2928     if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
2929     if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
2930     if x[1] == "tag" then
2931         style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
2932         style_tag = style_tag or {[\\PitonStyle{Tag}]}
2933     end
2934 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

2935 local Number =
2936     K ( 'Number' ,
2937         ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
2938             + digit ^ 0 * "." * digit ^ 1
2939             + digit ^ 1 )
2940         * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2941         + digit ^ 1
2942     )
2943 local string_extra_letters = ""
2944 for _ , x in ipairs ( extra_letters ) do
2945     if not ( extra_others[x] ) then
2946         string_extra_letters = string_extra_letters .. x
2947     end
2948 end
2949 local letter = alpha + S ( string_extra_letters )
2950         + P "â" + "â" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
2951         + "ô" + "û" + "ü" + "Â" + "Ã" + "Ç" + "É" + "È" + "Ê" + "Ë"
2952         + "ï" + "î" + "õ" + "û" + "Ü"
2953 local alphanum = letter + digit
2954 local identifier = letter * alphanum ^ 0
2955 local Identifier = K ( 'Identifier' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

2956 local split_clist =
2957 P { "E" ,
2958     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1

```

```

2959         * ( P "{" ) ^ 1
2960         * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
2961         * ( P "}" ) ^ 1 * space ^ 0 ,
2962     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
2963 }

```

The following function will be used if the keywords are not case-sensitive.

```

2964 local function keyword_to_lpeg ( name )
2965 return
2966   Q ( Cmt (
2967     C ( identifier ) ,
2968     function(s,i,a) return string.upper(a) == string.upper(name) end
2969   )
2970 )
2971 end
2972 local Keyword = P ( false )
2973 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

2974 for _ , x in ipairs ( def_table )
2975 do if x[1] == "morekeywords"
2976   or x[1] == "otherkeywords"
2977   or x[1] == "moredirectives"
2978   or x[1] == "moretexcs"
2979 then
2980   local keywords = P ( false )
2981   local style = {[\\PitonStyle{Keyword}]}
2982   if x[1] == "moredirectives" then style = {[\\PitonStyle{Directive} ]] end
2983   style = tex_option_arg : match ( x[2] ) or style
2984   local n = tonumber ( style )
2985   if n then
2986     if n > 1 then style = {[\\PitonStyle{Keyword}]] .. style .. "}" end
2987   end
2988   for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
2989     if x[1] == "moretexcs" then
2990       keywords = Q ( [[\]] .. word ) + keywords
2991     else
2992       if sensitive

```

The documentation of `lslistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

2993   then keywords = Q ( word ) + keywords
2994   else keywords = keyword_to_lpeg ( word ) + keywords
2995   end
2996 end
2997 end
2998 Keyword = Keyword +
2999   Lc ( "{" .. style .. "{" ) * keywords * Lc "}"
3000 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

3001 if x[1] == "keywordsprefix" then
3002   local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3003   PrefixedKeyword = PrefixedKeyword
3004   + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )

```

```

3005     end
3006 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

3007 local long_string = P ( false )
3008 local LongString = P (false )
3009 local central_pattern = P ( false )
3010 for _ , x in ipairs ( def_table ) do
3011   if x[1] == "morestring" then
3012     arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3013     arg2 = arg2 or {[\\PitonStyle{String.Long}]}
3014     if arg1 ~= "s" then
3015       arg4 = arg3
3016     end
3017     central_pattern = 1 - S ( " \r" .. arg4 )
3018     if arg1 : match "b" then
3019       central_pattern = P ( [[\]] .. arg3 ) + central_pattern
3020     end

```

In fact, the specifier `d` is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

3021   if arg1 : match "d" or arg1 == "m" then
3022     central_pattern = P ( arg3 .. arg3 ) + central_pattern
3023   end
3024   if arg1 == "m"
3025     then prefix = lpeg.B ( 1 - letter - ")" - "]" )
3026   else prefix = P ( true )
3027   end

```

We can write the pattern which matches the string.

```

3028 local pattern =
3029   prefix
3030   * Q ( arg3 )
3031   * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3032   * Q ( arg4 )

```

First, we create `long_string` because we need that LPEG in the nested comments.

```

3033 long_string = long_string + pattern
3034 LongString = LongString +
3035   Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" ) * Cc "{}" )
3036   * pattern
3037   * Ct ( Cc "Close" )
3038 end
3039 end
3040
3041 local braces = Compute_braces ( String )
3042 if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3043
3044 DetectedCommands = Compute_DetectedCommands ( lang , braces )
3045
3046 LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

3047 local CommentDelim = P ( false )
3048
3049 for _ , x in ipairs ( def_table ) do
3050   if x[1] == "morecomment" then
3051     local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3052     arg2 = arg2 or {[\\PitonStyle{Comment}]}

```

If the letter `i` is present in the first argument (eg: `morecomment = [si]{(*){}}`), then the corresponding comments are discarded.

```

3053   if arg1 : match "i" then arg2 = {[\\PitonStyle{Discard}]]} end
3054   if arg1 : match "l" then

```

```

3055 local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3056           : match ( other_args )
3057 if arg3 == [[\#]] then arg3 = "#" end -- mandatory
3058 CommentDelim = CommentDelim +
3059   Ct ( Cc "Open"
3060     * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3061     * Q ( arg3 )
3062     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3063   * Ct ( Cc "Close" )
3064   * ( EOL + -1 )
3065 else
3066   local arg3 , arg4 =
3067     ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
3068 if arg1 : match "s" then
3069   CommentDelim = CommentDelim +
3070     Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3071     * Q ( arg3 )
3072     *
3073       CommentMath
3074         + Q ( ( 1 - P ( arg4 ) - S "$\r" ) ^ 1 ) -- $
3075         + EOL
3076         ) ^ 0

## 11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

## **Changes between versions 2.8 and 3.0**

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by `listings`. Therefore, it's possible to say that virtually all the informatic languages are now supported by piton.

## **Changes between versions 2.7 and 2.8**

The key `path` now accepts a *list* of paths where the files to include will be searched.  
New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

## **Changes between versions 2.6 and 2.7**

New keys `split-on-empty-lines` and `split-separation`

## **Changes between versions 2.5 and 2.6**

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

## **Changes between versions 2.4 and 2.5**

New key `path-write`

## **Changes between versions 2.3 and 2.4**

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

## **Changes between versions 2.2 and 2.3**

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

## **Changes between versions 2.1 and 2.2**

New key `path` for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

## **Changes between versions 2.0 and 2.1**

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

## **Changes between versions 1.6 and 2.0**

The extension `piton` now supports the computer languages OCaml and C (and, of course, Python).

## Changes between versions 1.5 and 1.6

New key `width` (for the total width of the listing).

New style `UserFunction` to format the names of the Python functions previously defined by the user.

Command `\PitonClearUserFunctions` to clear the list of such functions names.

## Changes between versions 1.4 and 1.5

New key `numbers-sep`.

## Changes between versions 1.3 and 1.4

New key `identifiers` in `\PitonOptions`.

New command `\PitonStyle`.

`background-color` now accepts as value a *list* of colors.

## Changes between versions 1.2 and 1.3

When the class `Beamer` is used, the environment `{Piton}` and the command `\PitonInputFile` are “overlay-aware” (that is to say, they accept a specification of overlays between angular brackets).

New key `prompt-background-color`

It’s now possible to use the command `\label` to reference a line of code in an environment `{Piton}`. A new command `\_` is available in the argument of the command `\piton{...}` to insert a space (otherwise, several spaces are replaced by a single space).

## Changes between versions 1.1 and 1.2

New keys `break-lines-in-piton` and `break-lines-in-Piton`.

New key `show-spaces-in-string` and modification of the key `show-spaces`.

When the class `beamer` is used, the environments `{uncoverenv}`, `{onlyenv}`, `{visibleenv}` and `{invisibleenv}`

## Changes between versions 1.0 and 1.1

The extension `piton` detects the class `beamer` and activates the commands `\action`, `\alert`, `\invis`, `\only`, `\uncover` and `\visible` in the environments `{Piton}` when the class `beamer` is used.
